Abstract

Molecular and ionic transport through graphene membranes

Pengzhan Sun[1]

It is widely believed that, despite being one-atom thick, graphene and other 2D crystals is completely impermeable to all gases and liquids. In this talk, I will present my recent research[1-4] on the topic "Molecular transport through angstroporous 2D crystals."

Using monocrystalline container made from atomically flat graphite, which is tightly sealed with graphene, we have achieved measurements that put the permeation limit through 2D materials at 8–9 orders of magnitude lower than previously, such that we would discern (but did not observe) just a few helium atoms per hour crossing micrometer-size membranes. This detection limit is also valid for all other gases tested, except for hydrogen. Hydrogen shows noticeable permeation, even though its molecule is larger than helium. The mechanism of this anomalous observation is proposed and later corroborated by experiments. To make the generally "impermeable" graphene not only "permeable" but also highly "selective", we have developed a perforation technique which involves a short-time exposure of the graphene membrane to low-energy electrons. Using the same monocrystalline containers, we are able to study gas transport through the created individual graphene pores with an effective size of about one missing carbon ring. Helium and hydrogen permeate easily through these pores whereas larger molecules such as xenon and methane are blocked. Permeating gases experience activation barriers that increase quadratically with the kinetic diameter, and the transport process crucially involves surface adsorption.

Curriculum Vitae

Pengzhan Sun is an assistant professor at Institute of Applied Physics and Materials Engineering, University of Macau. He obtained his Bachelor's degree in Mechanical Engineering and Automation (2012) and Ph.D. degree in Materials Science and Engineering (2016), both from Tsinghua University. From 2016 to 2022, he was a research associate working at Department of Physics and Astronomy and National Graphene Institute (NGI), University of Manchester. His research interests include fundamental understanding of molecular transport under confinement, the synthesis and processing of 2D crystals building blocks and their rationally designed assemblies for emerging technologies in environment, energy, informatics, etc. He has published over 20 papers as first/corresponding authors in decent journals including Nature, PNAS, Nature Communications, Science Advances, etc. Also, he has been awarded with many important prizes including Materials Research Society (MRS, USA) Graduate Student Award, NSFC Excellent Young Scientist Fund, etc.
